

# Responding to Parents' Vaccine Concerns: What's in Our Toolbox?

Tammy Pilisuk, MPH

California Department of Public Health

Immunization Branch

May, 2010

# ARE WE POISONING OUR KIDS IN THE NAME OF PROTECTING THEIR HEALTH?

# It's Scary Out There!

COMPARISON OF CDC MANDATORY SCHEDULE  
Children birth to six years (recommended month)

Green our vaccines.  
And administer them  
with greater care.

**Mercury. Aluminum. Formaldehyde. Ether. Antifreeze.** Not exactly what you'd expect—or want—to find in your child's vaccinations. Vaccines that are supposed to safeguard their health yet, according to our studies, can also do harm to some children.

The statistics speak for themselves. Since 1983, the number of vaccines the CDC recommends we give to our kids has gone from 10 to 36, a whopping increase of 260%. And, with it, the prevalence of neurological disorders like autism and ADHD has grown exponentially as well.

Just a coincidence? We don't think so. Thousands of parents believe their child's regression into autism was triggered, if not caused, by over-immunization with toxic ingredients and live viruses found in vaccines. The Centers for Disease Control and the American Academy of Pediatrics dispute this but independent research and the first-hand accounts of parents tell a different story.

### Why are we giving our children so many more vaccines so early in life?

Why do we only test vaccines individually and never consider the combination risk of vaccines administered together? Given the dramatic rise of autism to epidemic levels, isn't it time for the scientific community to seriously consider the anecdotal evidence of so many parents? We urge the CDC and AAP to help us find the answers to these questions and learn why the increase in the number and composition of so many vaccinations has led to a surge in neurodevelopmental disorders. Our children deserve no less.

GENERATION RESCUE  
[www.generationrescue.org](http://www.generationrescue.org)

# Sound Familiar?

- Vaccines may cause autism
- “Too many too soon” overwhelm baby’s system
- Thimerosal = mercury poisoning
- “Toxic” ingredients (aluminum)
- VPDs gone anyway—why bother?
- VPDs “not a big deal,” give natural immunity
- Doctors influenced by Big Pharma
- Can’t trust gov’t safety testing
- Certain children can’t handle vaccines
- IZ schedule is too rigid

# Paradox of Empowerment

- Parents still likely to trust the doctor BUT...
- Want to do their own research

**Make your own choices!**

**Trust me!**

# Where do Moms Turn? Dr. Google!

**THE DOUGLASS REPORT**  
Real Health News from Medicine's Most Notorious Myth-Buster

“Immunizations are downright dangerous”

**National Vaccine Information Center... very useful information about state vaccination laws and exemptions...**

# I do my own research... a mom blogs

I studied, read and researched everything I could about vaccines. What I found out scared me to death.

The cover-ups, the pharmaceutical kick-backs to the medical community, doctor and pediatric lies, the public schools with their kick backs and rewards.

I could not believe what I discovered. Mercury in the vaccines (which causes neurotoxicity especially in fetuses and small infants)...thimerosal is linked to increase in autism in a confidential CDC study....

You could link all non-independent studies-which shows that there is no Mercury in vaccinations, and that it has no correlation to Autism directly to Pharmaceutical companies who paid for the study.

# How do we define compassion?

*“...if you should absolutely refuse to vaccinate your child despite all our efforts, we will ask you to find another health care provider who shares your views. We do not keep a list of such providers, nor would we recommend any such physician.”*

**AAP Chapter newsletter  
piece, posted online**

*“The bottom line is that more and more parents want options. If we don't provide them with options they are comfortable with, more parents will opt out of vaccines altogether. We will then see more and more disease fatalities and complications.”*

**Dr. Bob**

# Dr Sears Philosophy...

- Spread vaccines out over first few years—instead of first 18 months.... “But ultimately the end result is the same - a fully vaccinated child.” Gives:
- “the most important vaccines first, and slightly delays the less important vaccines.”
- 2 vaccines at a time to allow “a baby's body to better detoxify the chemicals.”
- 1 aluminum-containing vaccine at a time (instead of 4)
- 1 live-virus vaccine component at a time “to allow the body's immune system to better handle the live viruses in these vaccines.”
- “May decrease side effects; and makes it easier to figure out which vaccine a child is reacting to”

# Dr. Bob's Alt Schedule

- **2 mos** DTaP, rotavirus
- **3 mos** Pc, HIB
- **4 mos** DTaP, rotavirus
- **5 mos** Pc, HIB
- **6 mos** DTaP, rotavirus
- **7 mos** Pc, HIB
- **9 mos** Polio, Flu (2 doses)
- **12 mos** mumps, polio
- **15 mos** Pc, HIB
- **18 mos** DTaP,
- **21 mos** Flu
- **2 yrs** Rubella, Polio
- **2 1/2 yrs** Hep B, Hep A
- **3 yrs** Hep B, Hep A
- **4 yrs** DTaP, Polio, Flu
- **5 yrs** MMR, Flu
- **6 yrs** varicella
- **12 yrs** Tdap, HPV
- **12 yrs, 2mos** HPV
- **13 yrs** HPV, Mening.

Varicella

## Choosing Not to Vaccinate

- When I joined CafeMom I noticed that a lot of mothers did not vaccinate their children. I was appalled to notice that in almost every group moms **were being degraded for choosing not to vaccinate, to delay vaccinating or minimally vaccinate. I felt so alone in my decision...**

# Mommy Instinct

by [Petulant Pixie](#) May 3, 2005

OK, I got the vaccine sheet from the hospital, and there is **NO WAY** I am following the recommendations (which I understand are from the CDC, not a fly-by-night organization, I know, but still...)...

...it says at 2 months, they're supposed to get the DTP, Polio, Hib, and PCV. That's **SIX** different vaccines (since the DTP vaccinates against three illnesses). At 2 **MONTHS** of age. That just can't be good!

I was thinking to do the DTP at the 2 month check up. Then the Polio and the Hib three weeks later and then the PCV three weeks after that. That would leave 2 weeks between the PCV and the DTP boost at 4 months, then wait three weeks for the Polio and the Hib again...

**Has anyone done an alternate vaccine schedule? Can you tell me what you did and when, and how did it go?**

# What Can We Do?

- Peruse the web; see what they see!
- Read Offit's "*Autism's False Prophets*"
- **Empathize** with parents' fear, confusion
- Aim for "fence sitters"
- Know & share key resources

**Vaccine Safety: Responding to Parents' Top 10 Concerns**

**Talking with Parents About Vaccine Safety**

**Alternative Vaccine Schedules: Helping Parents Separate Fact from Fear**

**A few tips on how**

1. **Take time to listen.** Encourage an ongoing dialogue. Try to address the parent's concern in your own words.
2. **Validate their concern.** It is a parent's top job to be alert to every child's unique developmental needs.
3. **Use a "heart and head" approach.** Listen and consider the parent's concern as an individual. Try to address the parent's concern in your own words.
4. **Balance risks and benefits.** Help parents understand the risks and benefits of vaccine-preventable diseases can help parents appreciate the benefits of vaccination.

**A Guide for Physicians**

Parents want to keep their children safe and healthy, they empower parents to make an informed decision about vaccinating their kids. Questions about the recommended immunization schedule creates an opportunity for you to listen and respond to requests for "alternative schedules," including the Dr. Bob Steer's schedule. We offer these tips to assist practitioners to respond effectively and compassionately and to build trusting relationships with parents and patients.

**CONCERN:** CDC schedules seem generic; alternative schedules cater to individual needs. The immunization schedule exists to protect everyone at the age they are most vulnerable to each disease. Children are vaccinated as soon as they are developmentally able to create an effective immune response.

Explain: Alternative schedules are not custom-made. There's actually what doctors do. Doctors assess a patient's medical history and give the best advice for each child. There are especially important to many medically-vulnerable kids (whose parents may be concerned about vaccines).

Ask: Do you have specific concerns about your child's health? Let's talk about it.

**CONCERN:** "Too many" vaccines, "too soon" seem to be harmful.

Are there more vaccines now than 20 years ago? Yes—and that's a good thing. Never received care causes from vaccine-preventable diseases like meningococcal disease. This devastating infection can cause organ failure, limb amputations, and brain damage. Postponing shots increases the time a child's defenses. Recent outbreaks of measles and mumps are the postponing shots that healthy kids at risk for disease have if we thought about come soon.

Explain: A baby's immune system can handle multiple shots with ease and at the same time much better than it can fight off a serious disease. Postponing shots means your child must get sick and risk serious complications. It's essential you want to protect your child, but alternative schedules take advantage of parents' worries; they're not based on science.

Ask: Which vaccines are causing you worry?

California Immunization Coalition (CIC) - IMM 915 (1/11)

# Toolbox for Parents

**Vaccine Safety:**  
**10 Facts for Parents**

As a parent, you want to make the best decisions to protect your child. Being informed helps you talk with your doctor—and keep your family healthy. Your questions are important and you deserve reliable information to support your decisions. This fact sheet has been reviewed by medical experts. If you want to learn more, ask your doctor for a “consultation visit,” or check out the websites at the end.

**1. Are Vaccines safe?**  
Yes, vaccines are safe. Millions of children and adults are vaccinated every year. However, any medicine can cause reactions in some people. The most common **side effects**, are swelling or tenderness at the injection site and fever. Serious reactions are very rare, happening in 1-2 people out of a million shots given.

Thousands of people take part in clinical trials to test a vaccine before it is licensed by the **Food and Drug Administration (FDA)**. After it's licensed, the **Vaccine Adverse Events Reporting System (VAERS)** helps track any health effect that happens hours, days, weeks, or even months later. Anyone can report a possible side-effect so that it can be studied. This **monitoring** helps ensure vaccines are safe.

**2. Why do children today get so many immunizations?**  
To save lives. Advances in medical science have developed vaccines to protect us against more than 15 dangerous diseases. Only a few years ago vaccines prevented just a small handful of diseases. Who benefits most? Babies. Their bodies may be too weak to fight off a serious disease. Many vaccine-preventable diseases can have dangerous complications. These include seizures, brain damage, blindness, and even death.

**3. Are diseases of the “old days” really still something to worry about?**  
Diseases do exist—though many young parents haven't seen them. This is the success of our country's immunization program. But people not vaccinated, especially children, are at risk for common illnesses like **diphtheria, whooping cough, and chicken pox**. Did you know that before the chicken pox vaccine, almost 11,000 Americans had to go to the hospital, and over 100 died, each year from chicken pox? Less common diseases like **measles, mumps, and rubella** happen unexpectedly and can spread quickly. Some
